

## SUPPORT

## SUPPORTS TERTIARY HOW

## FOR WHY-WHAT · WHAT-WHY

# Timeboxed Detail Sprints

A method for batching detail work into short, scheduled, high-energy blocks. **The drain gets contained to windows you chose**, instead of leaking across the whole week.

## THE DRAIN

Detail work resisted is detail work that spreads. Left unscheduled, tertiary HOW tasks get pushed to the end of tired days, done badly, or avoided until they become urgent. The drain is real either way; unmanaged, it also comes with guilt and worse output.

## WHAT THIS TOOL DOES

Sprints flip the ownership. Similar detail tasks get batched and assigned to short blocks, twenty-five to forty minutes, placed at your highest-energy point in the day, with a hard stop and recovery time in primary-orientation work immediately after. Same work, dramatically lower cost per unit.

## HOW TO USE IT

- 1 Collect detail work into a single list.** The Detail Debt Log feeds this directly.
- 2 Book two sprints a week, recurring.** Protected calendar blocks at your best hours. Treat them like client meetings.
- 3 One category per sprint.** Numbers sprint, formatting sprint, follow-up sprint. Batching is the multiplier.
- 4 Stop at the timer.** Unfinished items roll to the next sprint. The hard stop is what makes the commitment sustainable.

### The sprint recipe

- |                  |                                                                                           |
|------------------|-------------------------------------------------------------------------------------------|
| <b>1 Batch</b>   | Group similar detail tasks; context-switching multiplies the drain.                       |
| <b>2 Place</b>   | Schedule at peak energy, never at the end of a depleted day.                              |
| <b>3 Box</b>     | Twenty-five to forty minutes with a visible timer and a hard stop.                        |
| <b>4 Recover</b> | Follow immediately with work in your primary orientation. Recovery is part of the method. |

### WHAT IT WON'T DO

Sprints reduce the cost of detail work; they do not turn it into something you will look forward to. If sprint volume keeps growing week over week, that is a structural signal: the role is carrying too much tertiary load, and the Triage Decision Tree is the next stop.
