SUPPORTS TERTIARY WHAT

FOR WHY-HOW · HOW-WHY

The 48-Hour Draft Rule

A protocol: any new deliverable produces a shareable rough draft within forty-eight hours. **Refinement comes after contact, not before.**

THE DRAIN

The natural sequence for a WHY-HOW or HOW-WHY profile is understand fully, then build once, correctly. The cost is the long dark period where nothing is visible and course corrections are impossible, and the deepest work arrives polished but sometimes pointed at the wrong target.

WHAT THIS TOOL DOES

The rule inverts the sequence for the first two days only. Within forty-eight hours of starting, a rough structural draft, ugly on purpose, goes to one named reader with one question attached. Errors of direction get caught at hour forty-eight instead of week four, which protects the deep work that follows.

The rule

- | | | |
|----------|------------------------------|--|
| 1 | Forty-eight hours | From kickoff to shareable rough draft. Structure, not polish. |
| 2 | Labeled v0.5 | The label sets the standard it should be judged by. This is armor, use it. |
| 3 | One named reader | A person, chosen for judgment, not a distribution list. |
| 4 | One question attached | "Is this the right shape?" The draft is an experiment; the question is its hypothesis. |
| 5 | Then depth | Direction confirmed, the thorough build proceeds with its foundation checked. |

HOW TO USE IT

- 1 Timebox the draft, two sessions max.** The constraint is what keeps it structural. A week-long "draft" defeats the purpose.
- 2 Draft the skeleton, not the muscle.** Headings, structure, the argument in bullets. Wrong-but-complete beats right-but-partial.
- 3 Send it before it feels ready.** It will not feel ready at hour forty-eight. That is the design, not a failure of it.
- 4 Bank the correction.** Each time the reader catches a direction error early, log it. That log is why the rule holds.

WHAT IT WON'T DO

The rule does not shorten the deep work, and it should not; it protects that work from being aimed wrong. It also is not for everything, small tasks need no draft, and some formal deliverables cannot circulate rough. Use it wherever direction errors are expensive.
